NI-DAQmx Linux C Cross-Compile Tips

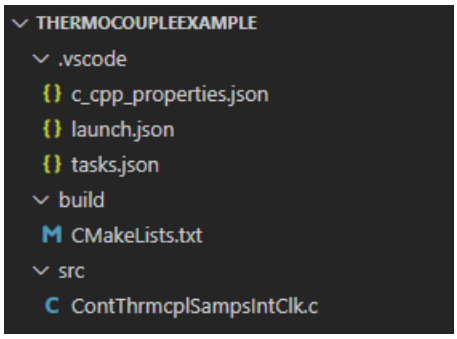
Overview

Before using this document, refer to the NI forum post, "NI Linux Real-Time Cross Compiling: Using the NI Linux Real-Time Cross Compile Toolchain with Visual Studio Code." After working through the examples, choose your desired C code from the "nidaqmx-c-examples" repository. The following steps utilize the "ContThrmcplSamps-IntClk.c" c source file from "\Analog In\Measure Temperature\Cont Thrmcpl Samples-Int Clk".

Note: this example was built with a Windows 10 host machine and cRIO-9040 (x64_Linux).

Steps

1. Install the NI-DAQmx driver on your host computer.
2. Install the NI-DAQmx driver on your NI Linux Real-Time target.
3. Install the correct GNU C & C++ Compile Tools for your NI Linux Real-Time target.
4. Locate the NIDAQmx.h header file in the following directory on your host computer: *C:\Program Files (x86)\National Instruments\NI-DAQ\DAQmx ANSI C Dev\include*.
5. Add the NIDAQmx.h header file to the *C:\build\18.0\x64\sysroots\core2-64-nilrt-linux\usr\include* directory in your host computer.
6. Add the contents of */usr/lib/x86_64-linux-gnu/* directory in your target to the *C:\build\18.0\x64\sysroots\core2-64-nilrt-linux\usr\lib* directory in your host computer.
7. Add the contents of the target's */usr/local/natinst/lib/* directory to the host's *C:\build\18.0\x64\sysroots\core2-64-nilrt-linux\usr\local\natinst\lib directory*.
8. Create a copy of the cross-compile project template in a directory of your choosing in the host computer, or use the sample set included in */samplebuildfiles*.
9. Open the directory in VSCode.



10. Modify the c_cpp_properties.json file, as shown below.

```json
{
    "env": {
        "compilerSysroots": "C:/build/18.0/x64/sysroots"
    },
    "configurations": [
        {
            "name": "NI Linux Real-Time x64",
            "compilerPath": "${compilerSysroots}/i686-nilrtsdk-mingw32/usr/bin/x86_64-nilrt-linux/x86_64-nilrt-linux-gcc",
            "compilerArgs": [
                "--sysroot=${compilerSysroots}/core2-64-nilrt-linux/"
            ],
            "includePath": [
                "${workspaceFolder}/**",
                "${compilerSysroots}/core2-64-nilrt-linux/usr/include"
            ],
            "cStandard": "c17",
            "cppStandard": "c++17",
            "intelliSenseMode": "gcc-x64"
        }
    ],
    "version": 4
}
```

11. Modify the tasks.json file, as shown below.

```json
{
    // See https://go.microsoft.com/fwlink/?LinkId=733558
    // for the documentation about the tasks.json format
    "version": "2.0.0",
    "tasks": [
        {
            "label": "CMake Generate Build Files",
            "type": "shell",
            "command": "cmake -G Ninja ${workspaceFolder}/build",
            "options": {
                "cwd": "${workspaceFolder}/build"
            },
            "problemMatcher": []
        },
        {
            "label": "Ninja",
            "type": "shell",
            "command": "ninja",
            "options": {
                "cwd": "${workspaceFolder}/build"
            },
            "problemMatcher": "$gcc"
        },
        {
            "label": "clean",
            "type": "shell",
            "command": "ninja clean",
            "options": {
                "cwd": "${workspaceFolder}/build"
            },
            "problemMatcher": []

        }
    ]
}
```

12. Add your Linux DAQmx example source code to the .src folder.
13. Modify the CMakeList.txt file, as shown below.
    a. **Note:** ensure that the add_executable command references the correct source code file for your application.
    b. **Note:** The series of add_library and set_property commands reference the .so files necessary for DAQmx to properly execute.

```
set(CMAKE_SYSTEM_NAME Linux)
set(CMAKE_SYSTEM_PROCESSOR x86_64)
set(toolchainpath C:/build/18.0/x64/sysroots)
set(CMAKE_C_COMPILER ${toolchainpath}/i686-nilrtsdk-mingw32/usr/bin/x86_64-nilrt-linux/x86_64-nilrt-linux-gcc.exe)
set(CMAKE_CXX_COMPILER ${toolchainpath}/i686-nilrtsdk-mingw32/usr/bin/x86_64-nilrt-linux/x86_64-nilrt-linux-g++.exe)
set(CMAKE_SYSROOT ${toolchainpath}/core2-64-nilrt-linux)
set(CMAKE_<LANG>_STANDARD_INCLUDE_DIRECTORIES ${toolchainpath}/core2-64-nilrt-linux/usr/include/c++/6.3.0 ${toolchainpath}
    /core2-64-nilrt-linux/usr/include/c++/6.3.0/x86_64-nilrt-linux)
set(CMAKE_<LANG>_FLAGS "-Wall -fmessage-length=0")
set(CMAKE_<LANG>_FLAGS_DEBUG "-O0 -g3")
set(CMAKE_<LANG>_FLAGS_RELEASE "-O3")
set(CMAKE_FIND_ROOT_PATH_MODE_PROGRAM NEVER)
set(CMAKE_FIND_ROOT_PATH_MODE_LIBRARY ONLY)
set(CMAKE_FIND_ROOT_PATH_MODE_INCLUDE ONLY)
set(CMAKE_FIND_ROOT_PATH_MODE_PACKAGE ONLY)

# project specific information
cmake_minimum_required(VERSION 3.7.2)
project(ThermocoupleExample)
```

```
set(EXECUTABLE_OUTPUT_PATH bin)
set(CMAKE_BUILD_TYPE Debug)

include_directories(${toolchainpath}/core2-64-nilrt-linux/usr/include)
add_executable(ThermocoupleExample ../src/ContThrmcplSampsIntClk.c)

# Note: ensure that you copy the contents of the real-
time system's /usr/local/natinst/lib folder into the respective folder in your development toolchain
add_library(nitargetcfg SHARED IMPORTED)

                      nidimu nidmxfu nimdbgu niorbu nipalu nidaqmx)
```

14. From the Command Palette (Ctrl + Shift + P), select Tasks: Run Task, and then “CMake Generate Build Files.” This will run the task created to allow Visual Studio Code to invoke CMake, as shown below.

```
PROBLEMS   OUTPUT   TERMINAL   DEBUG CONSOLE

> Executing task: cmake -G Ninja C:\Users\edavis\Documents\LocalPrograms\CrossCompileDAQLinux\ThermocoupleExample/build <

-- The C compiler identification is GNU 6.3.0

```

15. From the Tasks: Run Task, select Ninja to build the executable, as shown below.

```
PROBLEMS  OUTPUT  TERMINAL  DEBUG CONSOLE

-- Configuring done
-- Generating done
-- Build files have been written to: C:/Users/edavis/Documents/LocalPrograms/CrossCompileDAQLinux/ThermocoupleExample/build

Terminal will be reused by tasks, press any key to close it.

> Executing task: ninja <

[2/2] Linking C executable bin\ThermocoupleExample

Terminal will be reused by tasks, press any key to close it.
```

16. Copy the directory from your host computer to your target.
17. Through SSH, run the executable (located in /build/bin), as shown below.

```
admin@NI-cRIO-9040-01CF6403:~# cd ThermocoupleExample/build/bin
admin@NI-cRIO-9040-01CF6403:~/ThermocoupleExample/build/bin# ls
ThermocoupleExample*
admin@NI-cRIO-9040-01CF6403:~/ThermocoupleExample/build/bin# ./ThermocoupleExample
